

A total lunar eclipse will rise over the night sky this summer, and be the clearest viewing of this century in certain parts of the Earth. On July 27, a spectacular lunar eclipse will be fully visible for almost two hours.

If you have travel plans that could include a special night of wonder watching, you'll need to be in specific spots of South America, Africa, the Middle East or Central Asia. So if you're there on that historic occasion, be sure to bring your camera and/or smartphone with powerful telephoto lenses.
