

It may be years away, but aviation designer Charles Bombardier claims lightning-fast aircraft technology already exists. CNN reports that special engines, cabin design, oxygen fuel and other advancements will soon make the super-quick trip possible.

However, there are just a few minor problems that can't be overcome by such futuristic flight schedules. It will still take passengers hours to get from home to the airport through jammed roadways. And then, another hour for frisking and fondling through security. And another hour for fliers to board, fight for overhead bag space, get into their seats and buckle up.
